EXPERIMENT 07

Patient Appointment System Using Zoho Creator

Aim

To create a Patient Appointment Form in Zoho Creator and validate patient appointment details using a workflow and Deluge script.

Procedure

1. Open Zoho Creator and create an application named **Patient Appointment System**.

2. Create a form named **Patient Appointment Form**.

3. Add fields for patient name, phone number, doctor name, appointment date, appointment time, and reason for visit.

4. Mark essential fields as mandatory.

5. Open **Workflow** and create a form workflow for **Created** → **Validations on form submission**.

6. Add a Deluge Script action to validate the appointment date, time, and patient consent.

7. Replace example field link names with the exact link names used in the form.

8. Save the workflow and test it with valid and invalid appointment details.

9. Display saved appointments in a report and verify the results.

Application Design

Element	Design
Application	Patient Appointment System
Form	Patient Appointment Form
Fields	Patient_Name, Phone_Number, Doctor_Name, Appointment_Date, Appointment_Time, Rea
Workflow	Patient Appointment Validation
Trigger	Created → Validations on form submission
Validation	Reject past appointment dates, missing appointment time, and unchecked consent.

Deluge Example

Use this example only after confirming the field link names in your Zoho Creator form. The checkbox validation assumes Patient_Consent is a checkbox field.

```
// 1. Prevent past appointment dates
if(input.Appointment_Date < zoho.currentdate)
{
alert "Appointment date cannot be in the past. Please select a valid date.";
cancel submit;
}

// 2. Validate appointment time
if(input.Appointment_Time == null)
{
alert "Please select an appointment time.";
cancel submit;
}

// 3. Validate patient consent
if(input.Patient_Consent == false)
{
alert "Please confirm the patient information before submitting.";
cancel submit;
}
```

Validation and Discussion

Test	Expected outcome
Past appointment date	An alert appears and submission is cancelled.
Missing appointment time	An alert appears and submission is cancelled.
Consent not checked	An alert appears and submission is cancelled.
Valid appointment details	The form can be submitted if all mandatory fields are completed.

Result

The Patient Appointment System workflow design and Deluge validation example were prepared. The workflow must be configured and tested in Zoho Creator to confirm actual execution.

Note: Field link names and Deluge behavior may need adjustment to match the form configured in your account.
